## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claim 1 is rejected under 35 U.S.C. 102(e) as being anticipated by Hosur et al..

Hosur et al. disclose all the subject matter "a despreaders...calculated power of the control-data signal" as follows. Hosur et al. teach a WCDMA system using pilot symbol assisted channel estimation scheme, note Col. 1, lines 32-34. Hosur et al. teach the estimation value used to correct the manitude and phase distortion of the received data signal, note Col. 1, lines 45-46. Hosur et al. teach a ratio of the decoded data power to the pilot power is calculated to determine if data was transmitted, note Col. 1, lines 55-56. Hosur et al. teach the despreading by the inherency of the operation of the WCDMA receiver, note Col. 1, lines 15-23.

### *Allowable Subject Matter*

Claims 2-3 are allowed.

The following is an examiner's statement of reasons for allowance:

The present invention comprises a receiver for receiving a transmit data signal and a control data signal at powers that differ from each other, calculating a power ratio representing the ratio of the calculated power of the transmit-data signal to the calculated power of the

Art Unit: 2634

control-data signal. The receiver comprising a signal-level changing unit for raising, on the basis of the power ratio, the level of the signal which has the lowest power level. The closest prior art, Hosur et al., (US Patent Number 6,331,975) shows a similar circuit including a power calculation unit. However, Hosur et al. fails to teach a signal-level changing unit for raising the level of the signal which has the lowest power level. This distinct feature has been included in independent claim 2 rendering it allowable.

### ***Claim Objections***

Claims 4 and 5 are objected to because of the following informalities:

The claims are objected to because they include reference characters which are not enclosed within parentheses.

Reference characters corresponding to elements recited in the detailed description of the drawings and used in conjunction with the recitation of the same element or group of elements in the claims should be enclosed within parentheses so as to avoid confusion with other numbers or characters which may appear in the claims. See MPEP § 608.01(m).

Appropriate correction is required.
